## ProDrive Results - A Difference You Can Feel

The results are in, and after 3 weeks of use I can report that ProDrive is a tremendous improvement over standard air turbines. In my original post on ProDrive I described the concept behind the system. In the last 3 weeks I have done all of my crown & bridge preparations using Kavo handpieces that are identical except for the turbines.

I can now say without any doubt that ProDrive makes a significant and noticeable difference in handpiece performance. Comparing the 2 handpieces in a side by side comparison, the ProDrive system cuts faster, more efficiently, and reduces stress for both the operator and the patient. Whether it is preparing enamel or removing existing crowns, ProDrive is much smoother and efficient with no chattering.

I am so impressed with the performance that I am in the process of having all of my handpieces use ProDrive turbines and burs.

If you are in the midwest, you can purchase the ProDrive turbines and burs from Goetze Dental. In other parts of the U.S., you can contact ProDrive to find out who in your area is an authorized dealer.

If you have not heard of ProDrive yet... you will. This is an amazing product that gets my highest endorsement.
